ProHeal™

Healing is more than just granulation

The transformation of a non-healing wound from inflammation through granulation into epithelization phase is one of the major challenges in chronic wound treatment.

Based on our proprietary **2C Technology** ProHeal™ provides properties highly similar to the human dermis to support the body where its own wound healing mechanisms are impaired.

ProHeal™ consists of 100% dermal collagen and acts as biological therapy in the wound healing processes until final wound closure.
